

# DIESEL INJECTOR CLEANER

## Product Description:

### DIESEL INJECTOR CLEANER

Specific new generation product, to clean and maintain all types of injectors and pumps, especially the new generation COMMON RAIL-CDI-HDI-TDI-SDI.

The new injector technology for diesel engines works at much higher pressures than its predecessors, therefore, it is very important that the products used for cleaning and maintenance maintain the volume, density and compression power of diesel, otherwise the injector would be subjected to a greater stress than that which would correspond to injecting only diesel.

### ADVANTAGE

- It is a product that, as it does not contain any agent that alters the volume, density or compression power of diesel, is very effective for cleaning and maintaining state-of-the-art injectors, eliminating dirt and oxidation by avoiding the decantation of the water it contains diesel after engine shutdown.
- It is a very powerful decarbonizer that cleans carbon, preventing hardened carbon rosettes from forming in the compression chamber on the injector nozzle, ensuring that all the nozzle opening and closing rosettes are clean, avoiding dirt on rings and valve seats, including catalyst.
- Cleans the diesel oil of impurities and allows a better spraying of it, facilitating the mission of the injector, achieving a perfect and homogeneous diesel-air mixture, that the diesel burns in its entirety and, therefore, avoiding the emission of fumes, the creation of unburned (char) and overconsumption of diesel.

### HOW TO USE

1. Pour the product into the fuel tank.
2. Once the mixture is achieved, accelerate for 5 minutes while the vehicle is parked, and consume the mixture made in normal driving until the tank reserve.
